

👉 **PDOStatement::bindValue**: Binds a value to a parameter

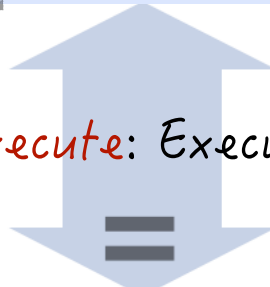

```
$priceNumber=60;  
$consoleName='XBOX';  
$sth = $db->prepare('SELECT * FROM tableOfDB WHERE price < :nb AND console = :cons');  
$sth->bindValue(':nb', $priceNumber);  
$sth->bindValue(':cons', $consoleName);  
$sth->execute();
```

```
$priceNumber=60;  
$consoleName='XBOX';  
$sth2 = $db->prepare('SELECT * FROM tableOfDB WHERE price < ? AND console = ?');  
$sth2->bindValue(1, $priceNumber);  
$sth2->bindValue(2, $consoleName);  
$sth2->execute();
```

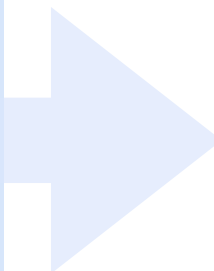

```
$sth3 = $db->prepare('SELECT * FROM tableOfDB WHERE price < ? AND console = ?');  
$sth3->execute(array(60, 'XBOX'));
```

👉 **PDOStatement::execute**: Executes a prepared statement

```
$priceNumber = 60;  
$consoleName = 'XBOX';  
$sth4 = $db->prepare('SELECT * FROM tableOfDB WHERE price < :nb AND console = :cons');  
$sth4->execute(array(':nb' => $priceNumber, ':cons' => $consoleName));
```

```
$priceNumber = 60;  
$consoleName = 'XBOX';  
  
$sth = $db->prepare('SELECT * FROM tableOfDB WHERE price < :nb AND console = :cons');  
$sth->bindValue(':nb', $priceNumber);  
$sth->bindValue(':cons', $consoleName);  
$sth->execute();  
echo '<p> 5, '.$sth->fetch()['colName'].'</p>';  
  
$sth2 = $db->prepare('SELECT * FROM tableOfDB WHERE price < ? AND console = ?');  
$sth2->bindValue(1, $priceNumber);  
$sth2->bindValue(2, $consoleName);  
$sth2->execute();  
echo '<p> 6, '.$sth2->fetch()['colName'].'</p>';  
  
$sth3 = $db->prepare('SELECT * FROM tableOfDB WHERE price < ? AND console = ?');  
$sth3->execute(array(60, 'XBOX'));  
echo '<p> 7, '.$sth3->fetch()['colName'].'</p>';  
  
$sth4 = $db->prepare('SELECT * FROM tableOfDB WHERE price < :nb AND console = :cons');  
$sth4->execute(array(':nb' => $priceNumber, ':cons' => $consoleName));  
echo '<p> 8, '.$sth4->fetch()['colName'].'</p>';
```
